Introduction

In this essay, two journals have been considered ~~of the for~~ analysis and comparison with each other. The first article that has been considered is the article based on the health apps, which are installed in mobile devices. Bad Apps: mHealth Apps Doubling as Medical Devices (Herron, J. (2016) will be the first article analysed. The discussion in the article has been made on how the app has been a bad influence on the health of the people due to their misleading promises and fake data. The second article by Hsu, J., Liu, D., Yu, Y. M., Zhao, H. T., Chen, Z. R., Li, J., & Chen, W. (2016) is 'The top Chinese mobile health apps: a systematic investigation' which has been considered ~~has~~ a discussion on the top health apps which are prominent in the Chinese market. The data in this article has been taken from the number of downloads of the app from the Android app market and the iOS app market. This essay discusses and compares both the papers, and the comparison and reflection has been drawn based on the CRAP test principles. The reflection has been based on the DIEP strategy and a conclusion has been made.

Comment [LS2]: Avoid colloquial language in professional and academic writing - applications

Discussion on Bad Apps: mHealth Apps Doubling as Medical Devices

In recent years, it has been seen that the use of the mobile apps has increased. The increase in the apps by the people has been mostly caused by the ease of accessibility to the mobile devices by people. The rates and prices of the mobiles devices has come down by a large number in recent years, which has allowed people to own smartphones. As people start using smartphones, the use of the apps increases as well. The smartphones are the devices which allow a person to buy and install app on their device, which can be used on the go. The spread and ease of use of the internet has also been a major cause of this widespread use of apps by the people.

Comment [LS3]: The detail you are providing in the introduction from the articles is becoming confusing. That is compounded by poor punctuation. The introductory paragraph/s should tell me what I can expect to read in the pages that follow.

Comment [LS4]: Are these your opinions? If not, you need to reference them, and/or tell me that you are presenting a summary of the journal article.

As apps have been made for almost everything that has been to be done by a person, it comes as no surprise that there has been an increase in the apps of the health management. These health management apps can be purchased or downloaded from the app stores and market places, and used on the mobile devices. There are number of health management apps, with a wide range of functionalities. The functionalities of these apps depends on the purpose for which the app has been developed. The apps have been available for almost all the platforms and devices. The specialisations which can be seen in the apps range from the basic medical helps and health routing tracing, to the recommendation of medicines and other such health related issues.

Comment [LS5]: Are these your opinions? If not, you need to reference them, and/or tell me that you are presenting a summary of the journal article.

The concern that the authors raise is about the influence of the apps on the health of the people using them. The authors say Herron (2016) claims that though some of the apps have a good performance and provide almost accurate data, most of the apps in the market are not based on accurate data, and can cause more harm than good to the people using the app. The simplicity and ease of use of the apps drive the people to download the apps and use them, but they might not always be accurate, and hence, can cause serious health related issues. The article is a data driven article which has based its theory on testing, analysing the facts of the apps, their usability, and the data which are stored on the apps.

Comment [LS6]: Are these your opinions? If not, you need to reference them, and/or tell me that you are presenting a summary of the journal article.

Discussion on The Top Chinese Mobile Health Apps

It has always seen that the Chinese market is always the first of all the countries to catch up and take on new technology. The Chinese market has always been accepted to the new and latest technological advancements, and implement them in their daily life. Ranging from production of the products and services for the new and trending theology, the Chinese market is also one of the world's largest consumer of the technology that are produced in their own market.

The development of the Chinese market in recent years have seen a dependency on the use of mobile apps in their day to day work. The apps have been made and implemented for almost everything, ranging from the tracking of time to tracking the number of steps taken by a person in a day. This use of apps has increased over the years by the ease of use of mobile phones, and availability cheap internet. The apps would be easily downloaded by a person on their mobile device, and used as per their liking.

Comment [LS7]: Are these your opinions? If not, you need to reference them, and/or tell me that you are presenting a summary of the journal article.

In this paper, the decision has been made on the top apps, which are used as health apps in ~~china~~China. As the use of apps has increased, the use of health apps has also increased over the years, and it can be seen that the people have developed a reliability on the apps which could be used as the health apps. The discussion in the paper has been made on the apps which ~~has have~~ been found most popular in the Chinese market. These apps could be used for various functionalities for the health management. Some of the apps can be used for simple tasks such as tracing of day to day activity of a person using the apps. Whereas, some of the apps has more complicated functionalities, and has also been seen to provide medical advice to the users of the apps, prescribing medicines and other such products, which are used by the user with reliability. The paper is a data paper, which has used the analysis of the data from the download records from the leading market places for the apps. The total number of downloads of an app has been considered as a criterion to check the popularity of an app, and the analysis has been made for top many apps for the app market in ~~china~~China. The number of apps that has been analysed here is 234.

Comment [LS8]: Not sure what you mean

Comment [LS9]: There is a lot of detail about the content of the article. You need to be applying the CRAP test to the article.

When you have a limited number of words to work with it is important to consider the relevance of what you write in relation to the task at hand.

Comparison and Reflection

The articles that ~~has hav~~ been considered in this report has been analysed thoroughly with the reference of the article themselves, and thereference of the data that has been used by the articles to reach the conclusion that has been made by the articles. The analysis has been

made from the study of the papers as a whole, and comparing the data that has been presented. The mood of the authors has been analysed in the comparison, and the theme that the author wishes to portray has been studied.

Comment [LS10]: Not sure what you mean

From the analysis done using Currency, Reliability, Authority and Purposetest (CRAP test) it can be seen that the both articles that has been compared have currency. The articles were published in 2016. Both the articles have been are related to the same topic of health mobile apps that are used by the people, instead of actual health specialists, to plan their medical care. The analysis has been made by the author in first paper on how the accuracy of the data that are presented in the apps are not always reliable. The unreliability of these data could lead to serious health hazards, and it should be prevented by the people by following the advice of actual health specialist, instead of following an app, which could have unrealised data. The app which just analyse the tracking data has not been found much danger, but the diet control apps and the apps which are related to the recommendation of medicines has been the most realisable ones. In the second paper, the author has made analysis on the apps that used by the people in China for their health management. The apps download has been considered in this always, and various considerations has been made on how the use and downloads of the apps are manipulated. The purpose of the health apps that are used by the users has been analysed, and the total number of apps which has been analysed in this paper is quite a large number, which is 234. In this paper, the author has made a very data driven paper, with charts and graphs for the portrayal and analysis of the data and conclusion presented by them.

Comment [LS11]: None of this relates to the CRAP Test.

I recommend you make an appointment to see and ALLaN for guidance in developing your assessment preparation, academic writing and referencing skills.

The reliability of these papers can be said to be accurate, as the papers are data driver, and the data source as well as analysis has been properly presented in the papers.

Conclusion

In this project, the discussion and analysis has been made on the comparison and reflection on two articles which are related to the same topic. The topic here selected is the use of health management apps by the people. The articles that has been analysed are discussion based on the reliability of the health management apps, and the usability of the apps by the people in China. The discussion and comparison has been made on both the articles, and a reflection has been made on the same. The CRAP test method has been used for this analysis, and it can be concluded that there indeed has been use of large number of health apps, which are unrealisable and can cause more harm to the health than good.

Thank you for your assessment . There are comments throughout. Overall you appear to have misunderstood the assessment task. There is an extensive assortment of resources and guidance available to you in the subject site that could have assisted you in preparing and presenting this assessment task.

To strengthen your assessment:

The introductory paragraph/s should tell me what I can expect to read in the pages that follow. For this assessment a brief overview of not more than 40 words would suffice.

I recommend you have the assessment task and marking rubric in front of you when you prepare your assessments to help keep you focused on the task at hand.

Have your work proof read prior to final submission. The reading should identify any errors in flow of your work, spelling and punctuation errors or inaccuracies in what you have written if the person reading the work has content knowledge/expertise.

I strongly recommend you make an appointment to see and ALLaN for guidance in developing your academic writing, assessment preparation and referencing skills.
